

TECH I'D LIKE TO SEE

IoT+5G+Cloud+AI

Today, the internet has more devices connected than humans and this is fundamentally driven by the rise of IoT, fueled by 5G starting to become mainstream. Now, couple this with the power of the cloud and AI, I see the rise of a very powerful phenomenon, namely, intelligence-as-a-service that permeates everything we do today. Resolving issues before customers complain or even realise, auto remediating and self-healing of IT systems & networks have already started happening. With advanced

AI and ML, we are inching towards a flawless world of systems.

As the world functions remotely, the usage of virtual immersive experience has become a competitive advantage. The combination of AR & VR, edge, and IoT devices along with a 5G powered low latency network connectivity will provide sports spectators and customers a controlled, personalised, and interactive experience. Connected smart stadiums will allow the audience to access the whole stadium in all its glory with one touch on their phones.
